1. System Overview

Engineered with Java Swing, the Cinema Ticket Management System orchestrates film catalogs and ticketing operations. Access control segregates staff permissions into Ticket Seller and Manager. Ticket Sellers handle movie queries, detailed schedule inspections, and seat bookings.

Inheriting base seller capabilities, Managers retain administrative authority over full movie CRUD lifecycles.

2. Login

Figure 1. Ticket Seller Login Screen

Figure 1 illustrates the authentication interface for Cinema Ticket Management System. Ticket sellers and managers input credentials, validating username-password pairs to gain role-conditioned system access.

Figure 2. Ticket Seller Main Interface

Upon authentication, Ticket Sellers inspect active film listings, navigating the operational suite authorized for their assigned role.

Figure 3. Searching for Movies

The query interface enables Ticket Sellers to filter film records by genre or title, retrieved results populate the target data grid.

Figure 4. Viewing Movie Details

Highlighting a record populates the metadata panel, detailing film identifier, title, director, runtime, pricing, schedule, genre-dependent features, and remaining seats.

Figure 5. Booking a Ticket

Executing reservation decrements remaining seat inventory by one upon confirmed transaction completion.

Figure 6. Sold-out Movie Handling

Upon inventory exhaustion, the system blocks subsequent purchases, triggering a sold-out notice to inform ticket sellers.

Figure 7. Manager Interface

Inheriting baseline cashier capabilities, the Manager portal incorporates expanded catalog management tools, record creation, modification, and deletion.

Figure 8. Add a Movie

Managers instantiate new film entries by populating all mandatory metadata attributes, primary Movie IDs enforce strict uniqueness.

Figure 9. Updating a Movie

Managers modify existing film records. Serving as the primary identifier, Movie ID persists immutably across all modification workflows.

Figure 10. Deleting a Movie

Managers purge film entries from the active catalog via row selection and invoking the deletion handler.

Figure 11. Exporting Movie Data

Invoking Export prompts a file selection dialog, persisting the current film dataset locally. Generated records incorporate real-time seat availability status.
